April 17, 2013

The Honorable Wilbur Hootch Sr.
Mayor
City of Emmonak
PO Box 9
Emmonak, AK 99581

Dear Mayor Hootch

Re: Emmonak Washeteria Report

I have enclosed a copy of the report prepared as part of the energy audit of the Emmonak Washeteria. The audit was prepared by the Energy Projects Group of the Department of Environmental Health and Engineering (DEHE) at the Alaska Native Tribal Health Consortium (ANTHC). Please feel free to contact me at 907-729-3543 or cremley@anthc.org if you have any questions.

Once the energy efficiency measures are implemented, the fuel and electricity costs to operate the Emmonak Washeteria will be reduced by approximately $11,237 per year or 21.5% of the $52,247 annual energy cost in 2012.

The energy audit was performed with EECBG funds provided by Department of Energy grant DE-EE0001883. We encourage the City of Emmonak to implement our recommendations. If funding the implementation is a concern, you might want to apply for the next round of EECBG funding.

Sincerely,

[Signature]

Carl H. Remley
Energy Projects Manager

PREFACE

The Energy Projects Group at the Alaska Native Tribal Health Consortium (ANTHC) prepared this document for the Emmonak Washeteria. The authors of this report are Carl Remley, Certified Energy Auditor (CEA) and Gavin Dixon.

The purpose of this report is to provide a comprehensive document that summarizes the findings and analysis that resulted from an energy audit conducted over the past couple months by the Energy Projects Group of ANTHC. This report analyzes historical energy use and identifies costs and savings of recommended energy efficiency measures. Discussions of site specific concerns and an Energy Efficiency Action Plan are also included in this report.

ACKNOWLEDGMENTS

The Energy Projects Group gratefully acknowledges the assistance of the staff of the Washeteria.
1. EXECUTIVE SUMMARY

This report was prepared for the City of Emmonak. The scope of the audit focused on Emmonak Washeteria. The scope of this report is a comprehensive energy study, which included an analysis of building shell, interior and exterior lighting systems, HVAC systems, and plug loads.

Based on electricity and fuel oil prices in effect at the time of the audit, the annual predicted energy costs for the buildings analyzed are $9,738 for Electricity and $40,993 for #1 Oil, with total energy costs of $50,732 per year.

Table 1.1 below summarizes the energy efficiency measures analyzed for the Emmonak Washeteria. Listed are the estimates of the annual savings, installed costs, and two different financial measures of investment return.

**Table Notes:**

1. Savings to Investment Ratio (SIR) is a life-cycle cost measure calculated by dividing the total savings over the life of a project (expressed in today’s dollars) by its investment costs. The SIR is an indication of the profitability of a measure; the higher the SIR, the more profitable the project. An SIR greater than 1.0 indicates a cost-effective project (i.e. more savings than cost). Remember that this profitability is based on the position of that Energy Efficiency Measure (EEM) in the overall list and assumes that the measures above it are implemented first.

2. Simple Payback (SP) is a measure of the length of time required for the savings from an EEM to payback the investment cost, not counting interest on the investment and any future changes in energy prices. It is calculated by dividing the investment cost by the expected first-year savings of the EEM.

With all of these energy efficiency measures in place, the annual utility cost can be reduced by $9,721 per year, or 19.2% of the buildings’ total energy costs. These measures are estimated to cost $39,239, for an overall simple payback period of 4.0 years.

Table 1.2 below is a breakdown of the annual energy cost across various energy end use types, such as Space Heating and Water Heating. The first row in the table shows the breakdown for the building as it is now. The second row shows the expected breakdown of energy cost for the building assuming all of the retrofits in this report are implemented. Finally, the last row shows the annual energy savings that will be achieved from the retrofits.

2. AUDIT AND ANALYSIS BACKGROUND

2.1 Program Description

This audit included services to identify, develop, and evaluate energy efficiency measures at the Emmonak Washeteria. The scope of this project included evaluating building shell, lighting and other electrical systems, and HVAC equipment, motors and pumps. Measures were analyzed based on life-cycle-cost techniques, which include the initial cost of the equipment, life of the equipment, annual energy cost, annual maintenance cost, and a discount rate of 3.0%/year in excess of general inflation.

2.2 Audit Description

Preliminary audit information was gathered in preparation for the site survey. The site survey provides critical information in deciphering where energy is used and what opportunities exist within a building. The entire site was surveyed to inventory the following to gain an understanding of how each building operates:

- Building envelope (roof, windows, etc.)
- Heating, ventilation, and air conditioning equipment (HVAC)
- Lighting systems and controls
- Building-specific equipment
- Water consumption, treatment (optional) & disposal

The building site visit was performed to survey all major building components and systems. The site visit included detailed inspection of energy consuming components. Summary of building occupancy schedules, operating and maintenance practices, and energy management programs provided by the building manager were collected along with the system and components to determine a more accurate impact on energy consumption.

Details collected from Emmonak Washeteria enable a model of the building’s energy usage to be developed, highlighting the building’s total energy consumption, energy consumption by specific building component, and equivalent energy cost. The analysis involves distinguishing
the different fuels used on site, and analyzing their consumption in different activity areas of the building.

Emmonak Washeteria is classified as being made up of the following activity areas:

1) Washeteria/Sauna: 2,573 square feet

In addition, the methodology involves taking into account a wide range of factors specific to the building. These factors are used in the construction of the model of energy used. The factors include:
- Occupancy hours
- Local climate conditions
- Prices paid for energy

2.3. Method of Analysis

Data collected was processed using AkWarm© Energy Use Software to estimate energy savings for each of the proposed energy efficiency measures (EEMs). The recommendations focus on the building envelope; HVAC; lighting, plug load, and other electrical improvements; and motor and pump systems that will reduce annual energy consumption.

EEMs are evaluated based on building use and processes, local climate conditions, building construction type, function, operational schedule, existing conditions, and foreseen future plans. Energy savings are calculated based on industry standard methods and engineering estimations.

Our analysis provides a number of tools for assessing the cost effectiveness of various improvement options. These tools utilize Life-Cycle Costing, which is defined in this context as a method of cost analysis that estimates the total cost of a project over the period of time that includes both the construction cost and ongoing maintenance and operating costs.

Savings to Investment Ratio (SIR) = Savings divided by Investment

Savings includes the total discounted dollar savings considered over the life of the improvement. When these savings are added up, changes in future fuel prices as projected by the Department of Energy are included. Future savings are discounted to the present to account for the time-value of money (i.e. money’s ability to earn interest over time). The Investment in the SIR calculation includes the labor and materials required to install the measure. An SIR value of at least 1.0 indicates that the project is cost-effective—total savings exceed the investment costs.

Simple payback is a cost analysis method whereby the investment cost of a project is divided by the first year’s savings of the project to give the number of years required to recover the cost of the investment. This may be compared to the expected time before replacement of the system or component will be required. For example, if a boiler costs $12,000 and results in a savings of $1,000 in the first year, the payback time is 12 years. If the boiler has an expected life to replacement of 10 years, it would not be financially viable to make the investment since the payback period of 12 years is greater than the project life.
The Simple Payback calculation does not consider likely increases in future annual savings due to energy price increases. As an offsetting simplification, simple payback does not consider the need to earn interest on the investment (i.e., it does not consider the time-value of money). Because of these simplifications, the SIR figure is considered to be a better financial investment indicator than the Simple Payback measure.

Measures are implemented in order of cost-effectiveness. The program first calculates individual SIRs, and ranks all measures by SIR, higher SIRs at the top of the list. An individual measure must have an individual SIR $\geq 1$ to make the cut. Next the building is modified and re-simulated with the highest ranked measure included. Now all remaining measures are re-evaluated and ranked, and the next most cost-effective measure is implemented. AkWarm goes through this iterative process until all appropriate measures have been evaluated and installed.

It is important to note that the savings for each recommendation is calculated based on implementing the most cost effective measure first, and then cycling through the list to find the next most cost effective measure. Implementation of more than one EEM often affects the savings of other EEMs. The savings may in some cases be relatively higher if an individual EEM is implemented in lieu of multiple recommended EEMs. For example implementing a reduced operating schedule for inefficient lighting will result in relatively high savings. Implementing a reduced operating schedule for newly installed efficient lighting will result in lower relative savings, because the efficient lighting system uses less energy during each hour of operation. If multiple EEM’s are recommended to be implemented, AkWarm calculates the combined savings appropriately.

Cost savings are calculated based on estimated initial costs for each measure. Installation costs include labor and equipment to estimate the full up-front investment required to implement a change. Costs are derived from Means Cost Data, industry publications, and local contractors and equipment suppliers.

2.4 Limitations of Study

All results are dependent on the quality of input data provided, and can only act as an approximation. In some instances, several methods may achieve the identified savings. This report is not intended as a final design document. The design professional or other persons following the recommendations shall accept responsibility and liability for the results.

3. Emmonak Washeteria

3.1 Building Description

The 2,573 square foot Emmonak Washeteria was constructed in 1990, with a normal occupancy of 10 people. The number of hours of operation for this building average 6.4 hours per day, considering all seven days of the week.
The Emmonak Washeteria is an older facility featuring washers, dryers, and a men’s and women’s sauna.

**Description of Building Shell**

The exterior walls are constructed with a 2x8 frame with R-19 insulation. The crawlspace is 2x4 with 3 inches of polyurethane insulation.

The roof of the building is a warm roof with 18 inches of fiberglass insulation.

The floor of the building is built on a leaky crawlspace with 12 inches of fiberglass insulation.

Typical windows throughout the building are double pane glass windows with vinyl frames.

Doors are metal with a fiberglass core.

**Description of Heating Plants**

The Heating Plants used in the building are:

Weil McLain Model 80 Series (680)
- Fuel Type: #1 Oil
- Input Rating: 680,000 BTU/hr
- Steady State Efficiency: 82%
- Idle Loss: 1.5%
- Heat Distribution Type: Glycol
- Boiler Operation: All Year

Weil McLain Model 80 Series (680)
- Fuel Type: #1 Oil
- Input Rating: 680,000 BTU/hr
- Steady State Efficiency: 82%
- Idle Loss: 1.5%
- Heat Distribution Type: Glycol
- Boiler Operation: All Year

**Space Heating Distribution Systems**

Baseboard heating is the primary delivery mechanism for heat in the facility.

**Domestic Hot Water System**

There are two 80 gallon domestic hot water heaters heated off the boilers, and supply 306 gallons of hot water to the facility per day, primarily to the washers and showers.

**Lighting**
Lighting in the facility is made up primarily T8 electronic fluorescent lighting with 32 watt bulbs. A pair of 70 watt high pressure sodium bulbs provide exterior lighting.

**Plug Loads**

A refrigerator, and a cash register make up the plug loads in the facility.

**Major Equipment**

10 Huebsch Model Htt30scDB2G1w01 dryers provide drying for the facility.

7 Continental Girbau Model EH040C11321111 washers provide the washing for the facility.

A series of Grundfos Magna 40-120F, Grundfos Magna 65-120F, Grundfos UP 15-18B7 pumps circulates heat to the dryers, saunas, and the facility space heating delivery system.

The saunas are heated primarily by heat off the Grundfos circulation pump loops, and taken to comfort levels with a Amerec 1712080-17 8.0 kilowatt heater.

### 3.2 Predicted Energy Use

#### 3.2.1 Energy Usage / Tariffs

The electric usage profile charts (below) represents the predicted electrical usage for the building. If actual electricity usage records were available, the model used to predict usage was calibrated to approximately match actual usage. The electric utility measures consumption in kilowatt-hours (kWh) and maximum demand in kilowatts (kW). One kWh usage is equivalent to 1,000 watts running for one hour.

The fuel oil usage profile shows the fuel oil usage for the building. Fuel oil consumption is measured in gallons. One gallon of #1 Fuel Oil provides approximately 132,000 BTUs of energy.

The following is a list of the utility companies providing energy to the building and the class of service provided:

Electricity: AVEC-Emmonak - Commercial - Sm

The average cost for each type of fuel used in this building is shown below in Table 3.1. This figure includes all surcharges, subsidies, and utility customer charges:

<table>
<thead>
<tr>
<th>Description</th>

</tr>
</thead>
<tbody>
<tr>
<td>Electricity</td>
<td>$0.15/kWh</td>
</tr>
<tr>
<td>#1 Oil</td>
<td>$6.74/gallons</td>
</tr>
</tbody>
</table>
### 3.2.1.1 Total Energy Use and Cost Breakdown

At current rates, City of Emmonak pays approximately $50,732 annually for electricity and other fuel costs for the Emmonak Washeteria.

Figure 3.1 below reflects the estimated distribution of costs across the primary end uses of energy based on the AkWarm© computer simulation. Comparing the “Retrofit” bar in the figure to the “Existing” bar shows the potential savings from implementing all of the energy efficiency measures shown in this report.

**Figure 3.1**
**Annual Energy Costs by End Use**

Figure 3.2 below shows how the annual energy cost of the building splits between the different fuels used by the building. The “Existing” bar shows the breakdown for the building as it is now; the “Retrofit” bar shows the predicted costs if all of the energy efficiency measures in this report are implemented.
Figure 3.2
Annual Energy Costs by Fuel Type

The figure shows how each heat loss component contributes to those costs; for example, the figure shows how much annual space heating cost is caused by the heat loss through the Walls/Doors. For each component, the space heating cost for the Existing building is shown (blue bar) and the space heating cost assuming all retrofits are implemented (yellow bar) are shown.

Figure 3.3
Annual Space Heating Cost by Component

The tables below show AkWarm’s estimate of the monthly fuel use for each of the fuels used in the building. For each fuel, the fuel use is broken down across the energy end uses. Note, in the tables below “DHW” refers to Domestic Hot Water heating.
3.2.2 Energy Use Index (EUI)

Energy Use Index (EUI) is a measure of a building’s annual energy utilization per square foot of building. This calculation is completed by converting all utility usage consumed by a building for one year, to British Thermal Units (Btu) or kBtu, and dividing this number by the building square footage. EUI is a good measure of a building’s energy use and is utilized regularly for comparison of energy performance for similar building types. The Oak Ridge National Laboratory (ORNL) Buildings Technology Center under a contract with the U.S. Department of Energy maintains a Benchmarking Building Energy Performance Program. The ORNL website determines how a building’s energy use compares with similar facilities throughout the U.S. and in a specific region or state.

Source use differs from site usage when comparing a building’s energy consumption with the national average. Site energy use is the energy consumed by the building at the building site only. Source energy use includes the site energy use as well as all of the losses to create and distribute the energy to the building. Source energy represents the total amount of raw fuel that is required to operate the building. It incorporates all transmission, delivery, and production losses, which allows for a complete assessment of energy efficiency in a building. The type of utility purchased has a substantial impact on the source energy use of a building. The EPA has determined that source energy is the most comparable unit for evaluation purposes and overall global impact. Both the site and source EUI ratings for the building are provided to understand and compare the differences in energy use.

The site and source EUIs for this building are calculated as follows. (See Table 3.4 for details):

\[
\text{Building Site EUI} = \frac{\text{Electric Usage in kBtu + Fuel Oil Usage in kBtu + similar for other fuels}}{\text{Building Square Footage}}
\]

\[
\text{Building Source EUI} = \frac{\text{Electric Usage in kBtu X SS Ratio + Fuel Oil Usage in kBtu X SS Ratio + similar for other fuels}}{\text{Building Square Footage}}
\]

where “SS Ratio” is the Source Energy to Site Energy ratio for the particular fuel.
Table 3.4

### 3.3 AkWarm© Building Simulation

An accurate model of the building performance can be created by simulating the thermal performance of the walls, roof, windows and floors of the building. The HVAC system and central plant are modeled as well, accounting for the outside air ventilation required by the building and the heat recovery equipment in place.

The model uses local weather data and is trued up to historical energy use to ensure its accuracy. The model can be used now and in the future to measure the utility bill impact of all types of energy projects, including improving building insulation, modifying glazing, changing air handler schedules, increasing heat recovery, installing high efficiency boilers, using variable air volume air handlers, adjusting outside air ventilation and adding cogeneration systems.

For the purposes of this study, the Emmonak Washeteria was modeled using AkWarm© energy use software to establish a baseline space heating and cooling energy usage. Climate data from Emmonak was used for analysis. From this, the model was be calibrated to predict the impact of theoretical energy savings measures. Once annual energy savings from a particular measure were predicted and the initial capital cost was estimated, payback scenarios were approximated. Equipment cost estimate calculations are provided in Appendix D.

### Limitations of AkWarm© Models

- The model is based on typical mean year weather data for Emmonak. This data represents the average ambient weather profile as observed over approximately 30 years. As such, the gas and electric profiles generated will not likely compare perfectly with actual energy billing information from any single year. This is especially true for years with extreme warm or cold periods, or even years with unexpectedly moderate weather.
- The heating and cooling load model is a simple two-zone model consisting of the building’s core interior spaces and the building’s perimeter spaces. This simplified approach loses accuracy for buildings that have large variations in cooling/heating loads across different parts of the building.
• The model does not model HVAC systems that simultaneously provide both heating and cooling to the same building space (typically done as a means of providing temperature control in the space).

The energy balances shown in Section 3.1 were derived from the output generated by the AkWarm© simulations.

4. ENERGY COST SAVING MEASURES

4.1 Summary of Results

The energy saving measures are summarized in Table 4.1. Please refer to the individual measure descriptions later in this report for more detail. Calculations and cost estimates for analyzed measures are provided in Appendix C.

#### 4.2 Interactive Effects of Projects

The savings for a particular measure are calculated assuming all recommended EEMs coming before that measure in the list are implemented. If some EEMs are not implemented, savings for the remaining EEMs will be affected. For example, if ceiling insulation is not added, then savings from a project to replace the heating system will be increased, because the heating system for the building supplies a larger load.

In general, all projects are evaluated sequentially so energy savings associated with one EEM would not also be attributed to another EEM. By modeling the recommended project sequentially, the analysis accounts for interactive affects among the EEMs and does not “double count” savings.

Interior lighting, plug loads, facility equipment, and occupants generate heat within the building. When the building is in cooling mode, these items contribute to the overall cooling demands of the building; therefore, lighting efficiency improvements will reduce cooling requirements in air-conditioned buildings. Conversely, lighting-efficiency improvements are anticipated to slightly increase heating requirements. Heating penalties and cooling benefits were included in the lighting project analysis.
### 4.3 Building Shell Measures

#### 4.3.1 Insulation Measures

<table>
<thead>
<tr>
<th>Rank</th>
<th>Location</th>
<th>Existing Type/R-Value</th>
<th>Recommendation Type/R-Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>Above-Grade Wall: Washeteria Crawlspace Exposed</td>
<td>Wall Type: Single Stud Siding Configuration: Siding and Sheathing Insul. Sheathing: None Structural Wall: 2 x 4, 16 inches on center Polyurethane (PLUR), 3.5 inches Window and door headers: Not Insulated Insulation Quality: Damaged Modeled R-Value: 14.8</td>
<td>Install R-20 rigid foam board to interior of wall.</td>
</tr>
</tbody>
</table>

**Installation Cost** $6,982  **Estimated Life of Measure (yrs)** 30  **Energy Savings (/yr)** $427  **Savings-to-Investment Ratio** 1.4  **Simple Payback yrs** 16

Auditors Notes: The crawlspace is venting a lot of heat, and should be insulated to reduce heat loss and heating costs in the facility.

<table>
<thead>
<tr>
<th>Rank</th>
<th>Location</th>
<th>Existing Type/R-Value</th>
<th>Recommendation Type/R-Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>Above-Grade Wall: Washeteria Main</td>
<td>Wall Type: Single Stud Siding Configuration: Siding and Sheathing Insul. Sheathing: None Structural Wall: 2 x 8, 16 inches on center R-19 Batt:FG or RW, 6 inches Window and door headers: Not Insulated Insulation Quality: Very Damaged Modeled R-Value: 12.2</td>
<td>Remove old insulation and install R-21 fiberglass batts in 2x6 wall.</td>
</tr>
</tbody>
</table>

**Installation Cost** $13,116  **Estimated Life of Measure (yrs)** 30  **Energy Savings (/yr)** $563  **Savings-to-Investment Ratio** 1.0  **Simple Payback yrs** 23

Auditors Notes: The ventilation in the building is likely very poor, and the steam from the saunas is causing a mold problem as well as damaging the insulation, reducing the ability to trap heat in the facility. This insulation should be torn out and replaced.

#### 4.3.2 Window Measures
4.4 Mechanical Equipment Measures

4.4.1 Heating/Cooling/Domestic Hot Water Measure

<table>
<thead>
<tr>
<th>Rank</th>
<th>Location</th>
<th>Size/Type, Condition</th>
<th>Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>Window/Skylight: Crawl Space Windows</td>
<td>Glass: Single, Glass Frame: Wood\Vinyl Spacing Between Layers: Half Inch Gas Fill Type: Air Modeled U-Value: 0.94 Solar Heat Gain Coefficient including Window Coverings: 0.52</td>
<td>Remove existing glass and replace with triple pane, 2 low-E, argon glass.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Installation Cost</th>
<th>Estimated Life of Measure (yrs)</th>
<th>Energy Savings (/yr)</th>
<th>$1,326</th>
<th>20</th>
<th>$177</th>
</tr>
</thead>
<tbody>
<tr>
<td>Breakeven Cost</td>
<td>Savings-to-Investment Ratio</td>
<td>Simple Payback yrs</td>
<td>$3,078</td>
<td>2.3</td>
<td>8</td>
</tr>
</tbody>
</table>

Auditors Notes: The steam from the saunas is lingering after the facility is no longer operating and night and damaging insulation. The HRV should be set to run for 3 hours after closing and then shut off. This would reduce moisture in the facility and limit electrical load.

4.4.2 Ventilation System Measures

<table>
<thead>
<tr>
<th>Rank</th>
<th>Description</th>
<th>Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Run HRV for three hours after facility use, then shut off.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Installation Cost</th>
<th>Estimated Life of Measure (yrs)</th>
<th>Energy Savings (/yr)</th>
<th>$10,000</th>
<th>7</th>
<th>$3,147</th>
</tr>
</thead>
<tbody>
<tr>
<td>Breakeven Cost</td>
<td>Savings-to-Investment Ratio</td>
<td>Simple Payback yrs</td>
<td>$20,051</td>
<td>2.0</td>
<td>3</td>
</tr>
</tbody>
</table>

Auditors Notes: The steam from the saunas is lingering after the facility is no longer operating and night and damaging insulation. The HRV should be set to run for 3 hours after closing and then shut off. This would reduce moisture in the facility and limit electrical load.

4.4.3 Night Setback Thermostat Measures

<table>
<thead>
<tr>
<th>Rank</th>
<th>Building Space</th>
<th>Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Washeteria/Sauna</td>
<td>Implement a Heating Temperature Unoccupied Setback to 60.0 deg F for the Washeteria/Sauna space.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Installation Cost</th>
<th>Estimated Life of Measure (yrs)</th>
<th>Energy Savings (/yr)</th>
<th>$1,500</th>
<th>15</th>
<th>$1,934</th>
</tr>
</thead>
<tbody>
<tr>
<td>Breakeven Cost</td>
<td>Savings-to-Investment Ratio</td>
<td>Simple Payback yrs</td>
<td>$26,231</td>
<td>17.5</td>
<td>1</td>
</tr>
</tbody>
</table>

Auditors Notes: A new setback thermostat should be installed and set to maintain the temperature of the facility at times it is unoccupied, such as at night, to only 60 degrees.
4.5 Electrical & Appliance Measures

4.5.1 Lighting Measures

The goal of this section is to present any lighting energy conservation measures that may also be cost beneficial. It should be noted that replacing current bulbs with more energy-efficient equivalents will have a small effect on the building heating and cooling loads. The building cooling load will see a small decrease from an upgrade to more efficient bulbs and the heating load will see a small increase, as the more energy efficient bulbs give off less heat.

4.5.1 Lighting Measures – Replace Existing Fixtures/Bulbs

<table>
<thead>
<tr>
<th>Rank</th>
<th>Location</th>
<th>Existing Condition</th>
<th>Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Exterior Lighting</td>
<td>2 HPS 70 Watt Magnetic with Manual Switching</td>
<td>Replace with 2 LED 20W Module StdElectronic</td>
</tr>
<tr>
<td></td>
<td>Installation Cost</td>
<td>$600 Estimated Life of Measure (yrs)</td>
<td>10 Energy Savings (/yr)</td>
</tr>
<tr>
<td></td>
<td>Breakeven Cost</td>
<td>$796 Savings-to-Investment Ratio</td>
<td>1.3 Simple Payback yrs</td>
</tr>
</tbody>
</table>

Auditors Notes: Replacing exterior lighting with LED lighting fixtures improves performance in the cold, reduces energy use, and reduces the need to replace light bulbs.

4.5.2 Other Electrical Measures

<table>
<thead>
<tr>
<th>Rank</th>
<th>Location</th>
<th>Description of Existing</th>
<th>Efficiency Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Installation Cost</td>
<td>$5 Estimated Life of Measure (yrs)</td>
<td>7 Energy Savings (/yr)</td>
</tr>
<tr>
<td></td>
<td>Breakeven Cost</td>
<td>$89 Savings-to-Investment Ratio</td>
<td>17.9 Simple Payback yrs</td>
</tr>
</tbody>
</table>

Auditors Notes: Only run water circulation pump to prevent freezing in winter time.

<table>
<thead>
<tr>
<th>Rank</th>
<th>Location</th>
<th>Description of Existing</th>
<th>Efficiency Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Installation Cost</td>
<td>$10 Estimated Life of Measure (yrs)</td>
<td>7 Energy Savings (/yr)</td>
</tr>
<tr>
<td></td>
<td>Breakeven Cost</td>
<td>$89 Savings-to-Investment Ratio</td>
<td>8.9 Simple Payback yrs</td>
</tr>
</tbody>
</table>

Auditors Notes: Glycol circulation pump doesn’t need to be run during the summer when there is no risk of the sewer line freezing.

4.5.3 Sauna Measures
4.5.4 Clothes Drying Measures

<table>
<thead>
<tr>
<th>Rank</th>
<th>Location</th>
<th>Description of Existing</th>
<th>Efficiency Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td></td>
<td>Install new temperature controls for Sauna.</td>
<td></td>
</tr>
<tr>
<td>Installation Cost</td>
<td>$3,500</td>
<td>Estimated Life of Measure (yrs)</td>
<td>15</td>
</tr>
<tr>
<td>Breakeven Cost</td>
<td>$9,659</td>
<td>Savings-to-Investment Ratio</td>
<td>2.8</td>
</tr>
<tr>
<td>Energy Savings (/yr)</td>
<td></td>
<td></td>
<td>$720</td>
</tr>
<tr>
<td>Breakeven Cost</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Auditors Notes: The saunas are running too hot, possibly beyond health standards, and are using an extremely high amount of energy. The controls should be replaced and monitored to maintain efficient, comfortable temperatures.

Appendix B – Direct Vent Oil Heater Programming

Using the temperature setbacks built into most direct vent oil heaters, such as Toyotomi Lasers and Monitor MPis is a simple, cost effective way to save energy. We recommend setback temperatures of 60 degrees for nights and weekends in offices and other frequently occupied facilities. In buildings that are occupied intermittently, such as Bingo Halls, we recommend a setback of 50 or 55 degrees. Facilities
that are never occupied, such as lift stations and well houses, should be setback to 40 degrees, to prevent freezeups. Check the following websites for tips on programming the built in temperature setback capabilities of your specific direct vent oil heater.
